KEMO – VBF10
Analogical filter pass-band of variable frequency at two channels

KEMO VBF10 filters permit to analogically filter the signals on two channels, in high-pass mode or in low-pass mode, at fixed arbitrary frequency between 0.1 Hz and 102.3 kHz. An amplification of the signals can also be made (from -11 to 70 dB by step of 1 dB). The system can also be used to obtain the sum or the difference of two analogical signals.
